

Ideation Phase Brainstorm & Idea Prioritization

Date	1 NOVEMBER 2025
Team ID	NM2025TMID07302
Project Name	Calculating Family Expenses using Service Now
Maximum Marks	4 Marks

Calculating Family Expenses using ServiceNow :

The project “**Calculating Family Expenses using ServiceNow**” aims to create a structured and automated solution for managing daily and monthly household expenses. This initiative demonstrates how ServiceNow’s powerful workflow capabilities can be applied beyond IT services to track, record, and categorize family spending efficiently. By creating custom tables, forms, and reports, the project provides a centralized platform where family members can input expenses such as groceries, rent, or utilities, ensuring accurate and organized financial records.

This solution emphasizes automation, transparency, and data integrity within family budgeting. ServiceNow workflows and business rules are used to calculate total expenses, generate category-wise summaries, and trigger notifications when spending exceeds preset limits. The project not only simplifies manual tracking but also showcases how ServiceNow can be adapted for personal finance management, promoting smarter decision-making and financial discipline in everyday life

Step-1: Team Gathering, Collaboration and Select the Problem Statement:

The project began with a collaborative team discussion to identify a real-life problem that could be effectively solved using ServiceNow. During the brainstorming session, the team explored several ideas related to personal management and automation. After evaluating different possibilities, the team selected “*Calculating and Managing Family Expenses using ServiceNow*” as the core problem statement.

This idea was chosen because managing household finances is a common challenge faced by many families, often requiring time-consuming manual calculations and record-keeping. By implementing this process through ServiceNow, the team aims to create an automated, efficient, and user-friendly system that allows users to record, categorize, and analyze their expenses. The selected problem statement promotes innovation by applying ServiceNow’s enterprise-level features to personal finance management, ensuring accuracy, transparency, and better financial control.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Step-2: Brainstorm, Idea Listing and Grouping:

In this phase, the team collaborated to generate and organize ideas to design the “Family Expense Management System” in ServiceNow. Team members shared suggestions on how to record, categorize, and calculate expenses efficiently. Various ideas were proposed, such as creating custom tables for expense tracking, developing forms for data entry, and automating calculations using business rules and workflows. This open brainstorming session encouraged creativity, ensuring that every idea was considered without criticism or limitation.

After collecting all ideas, the team documented them and began grouping similar suggestions into categories. Ideas related to data design, automation, and reporting were grouped together to identify patterns and simplify implementation planning. This process helped the team visualize the structure of the project clearly and select the most effective approach. Action points were created from these grouped ideas to guide the next development phase, ensuring that each idea contributes to the project’s overall goal of accurate and efficient family expense management.

Step-3: Idea Prioritization:

In this stage, the team focused on organizing and prioritizing the ideas generated during brainstorming to ensure a clear, step-by-step implementation of the *Family Expense Management System* in ServiceNow. The goal was to identify which ideas had the most impact on achieving accuracy, automation, and user-friendliness in calculating family expenses. Ideas were evaluated based on feasibility, effectiveness, and alignment with the project objectives.

The team decided to begin with creating the core database table for recording expenses, followed by designing user-friendly forms for data entry. Next, automation using business rules and workflows was prioritized to calculate totals and trigger notifications when expenses exceed defined limits. This systematic prioritization ensured that the project progressed efficiently from foundational setup to advanced automation and reporting, aligning with the overall goal of simplifying and improving family financial management.

Step-3: Idea Prioritization
